

Student Grade Average Calculator

Created by

Arnel Amor-II H. Oco

Program Description

This Python program asks the user to enter three subject grades. It calculates the average grade and determines whether the student passed or failed.

Concepts Used

- Variables
- Expressions
- Statements
- User Input
- Type Conversion
- Operators
- Comments

Objective

The objective of this program is to demonstrate how Python can perform calculations using variables, expressions, operators, and user input.

```
# =====  
# Program Title: Student Grade Average Calculator  
# Created by: Arnel Amor-II H. Oco  
#  
# Description:  
# This program asks the user to enter three subject  
# grades. It computes the average grade and determines  
# whether the student passed or failed.  
# =====  
  
# Ask the user for their name
```

```

student_name = input("Enter your name: ")

# Ask the user to enter grades
math_grade = float(input("Enter Math grade: "))
science_grade = float(input("Enter Science grade: "))
english_grade = float(input("Enter English grade: "))

# Compute the average grade
average_grade = (math_grade + science_grade + english_grade) / 3

# Display the results
print("\n===== Student Grade Summary =====")
print("Student Name:", student_name)
print("Average Grade:", average_grade)

# Determine if the student passed or failed
if average_grade >= 75:
    print("Status: Passed")
else:
    print("Status: Failed")

# End message
print("Thank you for using the Grade Average Calculator.")

```

Sample Output

Enter your name: Arnel Amor-II H. Oco

Enter Math grade: 98

Enter Science grade: 97

Enter English grade: 99

===== Student Grade Summary =====

Student Name: Arnel Amor-II H. Oco

Average Grade: 98.0

Status: Passed

Thank you for using the Grade Average Calculator.
